1- FUNCTION: MIGHT PLAY A ROLE IN THE PROPER FORMATION AND MAINTENANCE OF THE TRACHEA.

1- SUBCELLULAR LOCATION: Nuclear (Pocential).

1- DEVELOPMENTAL STAGE: EXPRESSED DURING SEVERAL PHASES OF EMBRYONIC DEVELOPMENT. IN THE EGG, BOTH THE RNA AND THE PROTEIN ARE MITERNAL IN ORIGIN AND SLOWLY DURING GASTRULATION. AFTER GERM BAND RETRACTION, HIGH LEVELS OF ZYGOTIC EXPRESSION ARE OBSERVED IN A DISTINCT SUBSET OF PERIPHERAL TRACHEAL CELLS DISTRIBUTED THROUGHOUT THE EMBRYO AND LOW LEVELS IN SOWATIC MUSCLE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PROSITE; PS001550; MADS BOX 1; 1.

Tianking region of the rat NKAA2 gene encoding the alpha 2 subunit.";
Gene 91.267-270(1990).
C. I- FUNCTION: THIS IS THE CATALYTIC COMPONENT OF THE ACTIVE ENZYME,
WHICH CHATALYZES THE PLASMA MEMBRANE. THIS EXCHANGE OF
WHICH CATALYZES THE PLASMA MEMBRANE. THIS ACTION CREATES THE
ELECTROCHEMICAL GRADIENT OF NA AND K, PROVIDING THE ENERGY FOR
ACTIVE TRANSPORT OF VARIOUS NUTRIENTS.
C. CATALYTIC ACTIVITY: ATP + H(2)O + Na(+)(In) + K(+)(Out) = ADP +
phosphate + Na(+)(Out) + K(+)(In)
C. -- SUBUNIT: COMPOSED OF THREE SUBUNITS: ALPHA (CATALYTIC), BETA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to the cation transport ATPases family (P-type
ATPases). Subfamily IIC.
                                                                                                                                                                                                                               Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Mammalia, Eutheria, Rodentia, Sciurognathi, Muridae, Murinae, Rattus. III SCIENCE 261:50-58 (1993)

SCIENCE 261:50-58 (1993)

- FUNCTION: MUSCLE CONTRACTION. MYOSIN IS A PROTEIN THAT BINDS TO FACTIN AND HAS APPASE ACTIVITY THAT IS ACTIVATED BY F-ACTIN.

- FUNCTION: MUSCLE MYOSIN IS A HEXAMENIC PROTEIN THAT CONSISTS OF 2 HEAVY CHAIN SUBUNITS (MAC).

- SUBUNIT: MUSCLE MYOSIN IS A HEXAMENIC PROTEIN THAT CONSISTS OF 2 HEAVY LIGHT CHAIN SUBUNITS (MAC).

- SUBCELLULAR LOCATION: Thick filaments of the myofibrils.

- DOMAIN: THE PODLIER TAIL SEDENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.

- PTW: TWO CYSTENER RESIDUES THE DOMAIN ARE SELECTIVELY ALKYLATED AND ARE REQUIRED FOR MYOSIN AFPASE ACTIVITY.

- MISCELLANGOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LAM) AND 1 HEAVY MEROMYOSIN (HM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED CONTRAINT (S2).

- SIMILARITY: Contains 1 myosin-like globular head domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PROSITE; PSS0096; IQ; I.

```
The present sequence is from an antithrombin III (ATIII) variant, F2À, derived from human ATII N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophile while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the colod vessel wall more efficiently than ATIIS with normal heparin affinity. The modified ATIIS can be used to treat thrombin activational supporting due to sepsit, trauma, acute respiratory distress syndrome, restences, thrombosis, trauma, acute and stroke. It can also be used to reduce the risk of reocclusion and stroke in percutaneous transluminal coronary angioplasty, thrombosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                             New modified human antithrombin III compounds, used for treating e.g. sepsis, trauma, acute respiratory distress syndrome, restenosis, thromboembolism or stroke -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.

The invention relates to isolated polynucleotide (I) and probes, polymerase chain reaction (PRR) primers, oligomers, and for chromosome polymerase chain reaction (PRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to reactive normal activity of (II) or to treat disease states involving or (II). (II) is useful for generating antibodies against it, detecting or quantitating a polymeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical diagnostics for and to polymentic disorders for cher treat protein expression or biological activity. The polymentic for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG1010-ABG3037 represent novel human conductive man or the printed and portunic for this patent did not appear in the printed conductive disparation, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis and adaptation (HA) proteins given in AAB79023 to AAB79242. The c. glutamicum HA genes (1) can be used in vectors for expression in host cells and production of fine chemicals, such as, an organic acid, proteinogenic or nonproteinogenic amino acid (preferred), purine or pyrimidine base, nucleoside, nucleotide, ippd, saturated or unsaturated fatty acid, diol, carbohydrate, arcmanic compound, vitamin, cofactor, polyketide or enzyme. The amino acids produced can be lysine, glutamine, polyketide or enzyme. The amino acids produced can be lysine, glutamine, cysteine, phenylalanine, aspartate, glycine, serine, thraconine, methionine, cysteine, phenylalanine, or tryptophan. The fine chemical production can be used for diagnosing the presence of (1) or HA proteins encoded by then are used for diagnosing the presence of activity of corynebacterium or diphtheriae. (1) can be used to map the C. glutamicum genome or can be used as markers for genetically engineered Corynebacterium or previbacterium. The HA proteins encoded by the (1) are used to maintain homeostasis in C. glutamicum or homeostasis in C. adapt to adapt to

AAF71753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB8021. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleotides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids from Corynebacterium glutamicum encoding metabolic pathway protetins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, and purine and pyrimidine bases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Schroeder H, Zelder O, Haberhauer G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       US-UN-4'1-613-2

Jequence 2, Application US/08471613

Patent No. 596256

GENERAL INFORMATION:

APPLICANT: David D. Moore

APPLICANT: Jae Woon Lee

APPLICANT: Jae Woon Lee

TITLE OF INVENTION: INTERACTING POLYPEPTIDES AND

TITLE OF INVENTION: INTERACTING POLYPERION: STREET BASSEAUSCHES ADDRESS: ADDRESSE: Fish & Richardson P.C.

STREET BASSEAUSCHES ADDRESS: ADDRESSE: Pish & Richardson P.C.

STREET BASSEAUSCHES FORM:

MEDIUM TYPE: 225 Franklin Street

CITY: Boston

STREET: US.A.

COMPUTER: IBAP FS/A Model 502 or 55SX

OPERATING SYSTEM: WG-DOS (Version 5.0)

CURBUTER: MordPerfect (Version 5.0)

CURBUTER: MordPerfect (Version 5.0)

CURBUTION NUMBER: US/OB/471,613

FILING DATE: OG-June-1995

CLASSIFICATION: 436

APPLICATION NUMBER: 07/969,136

FILING DATE: OG-DORY 30, 1992

CLASSIFICATION: 436

APPLICATION NUMBER: 30,162

REFERENCE OCCEPT NUMBER: 30,162

                                                                                                                                                                                                                                                                                                   USE-USE-190-899-25

Patent No. 6166202

GENERAL INFORMATION:

APPLICANT: CHERN, Maw-Sheng

TITLE OF INVENTION: MODIFICATION OF SEED CROPS WITH

TITLE OF INVENTION: MODIFICATION FACTORS

NUMBER OF SECTORNES: 32

CORRESPONDENCE ADDRESS:

ADDRESSE: DATING, Doane, Swecker & Mathis

STREET: P.O. Box 1404

CITY: Alexandria

STREET: Virginia

STREET: P.O. Box 1404

COUNTRY: United States

LIP: Alexandria

STREET: P.O. Box 1404

CONTRY: United States

LIP: ASSENTING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PatentIn Release #1.0, Version #1.30

CURRENT APPLICATION DATA:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention : useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL01840-ABL30511), expressed DNA sequences (ABL01840-ABL30511), expressed DNA (ABB57737-ABB72072)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
 the amino acid sequence of bZIP1 (basic leucine zipper) ORF3 protein
                                                                                      Gaps

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher evkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNs sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.

                                                                                                                                                                                                                                                                                           The present sequence is from an antithrombin III (ATIII) variant, Bb.B derived from human ATIII.N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 185-393. The variant has expression construct and comprises residues 185-393. The variant has expressed as glycoforms with enhanced heparin affinity which target the expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activational expiratory distress syndroms (use to Sepsis, trauma, acute and stroke. It can also be used to reduce the risk of reocclusion and restenois in percutaneous transluminal coronary angioplasty, and restenois associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a number of nuclectide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutan of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium and identifying a homologue of a gene derived amino acids, nucleic acids, vitamins, saccharides and organic acids, in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                 Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Phillips J;

The present sequence represents a murine mu-opioid receptor (MOR-1) splice variant MOR-1G. The specification describes 11 new exons for the MOR-1 gene, which combine to yellal is novel splice variants of the MOR-1 gene, which combine to yellal is novel splice variants of modulating morphine analgesia and opioid-mediated ingestive responses. The MOR-1 polypeptide is used to screen compounds for opioid activity. Such compounds are potential analgesics or more generally agents that affect gastroincestimal motility, respiration or the immune, endocrine or autonomous nervous systems, e.g. regulators of peristalsis. Antagonists and ligands of MOR-1, as well as DNA vectors expressing MOR-1-encoding nucleic acids, or sequences antisense to WOR-1 nucleic acids, are used to regulate morphine analgesia and body weight. The level of MOR-1 or tissue distribution of MOR-1 can be measured to diagnose MOR-1 related pharmacological abnormalities or neuroendocrine disorders, particularly inherited disorders. Transgenic animals with extres or print, for more analgesia and heles and also as a second of the MOR-1 can be measured to diagnose MOR-1 related pharmacological abnormalities or neuroendocrine disorders, particularly inherited disorders. Transgenic animals with extress or the MOR-1 can be measured to diagnose MOR-1 related pharmacological abnormalities or animals with extress or property of the MOR-1 can be an animals with extress or the MOR-1 can be an animals with extress or the MOR-1 can be an animals with extress or the MOR-1 can be an animals with extress or the MOR-1 can be an animals with extress or the MOR-1 can be an animals with extress or the MOR-1 can be an animals with extress or the MOR-1 can be an animals with extress or the MOR-1 can be an animals with extress or the MOR-1 can be an animal with extress or the MOR-1 can be an animal with extress or the MOR-1 can be an animal with the can be an animal with t
                                                                                                                                                                                                                                                                                                                                New splice variants of the mu-opioid receptor, useful in screening selective analgesics and for regulating morphine analgesia or body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 endocrine aystem; autonomous nervous system; peristalsis regulator;

```
The present sequence represents a murine mu-opioid receptor (MOR-1) splice variant MOR-1H. The specification describes 11 new exons for the MOR-1 gene, which combine to yield 15 novel splice variants of the MOR-1 gene, which combine to yield 15 novel splice variants of modulating morphine analgesia and opioid-mediated ingestive responses. The MOR-1 polypeptide is used to screen compounds for opioid activity. Such compounds are potential analgesics or more generally agents that affect gastrointestinal motility, respiration or the immune, endocrine or autonomous nervous systems, e.g. regulators of peristalsis.

Antagonists, agonists and ligands of MOR-1, as well as DNA vectors or expressing MOR-1-encoding nucleic acids, or sequences antisense to MOR-1 nucleic acids, are used to regulate morphine analgesia and body weight. The level of MOR-1 or tissue distribution of MOR-1 can be measured to diagnose MOR-1 related pharmacological abnormalities or neuroendocrine disorders, particularly inherited disorders. Transgenic animals with extres of the MOR-1 gene, or with endogenous alleles
                                                                                                                                                                                                                               New splice variants of the mu-opioid receptor, useful in screening for selective analgesics and for regulating morphine analgesia or body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

The present sequence is from an antithrombin III (ATIII) variant, 13.B derived from human ATII.N155A CDNA insert of the pBlueBac baculovinus expression construct and comprises residues 385-393. The variant has expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIS with normal heparin affinity. The modified ATIIIS can be used to treat thrombin activation-related pathological symptoms due to sepsis, trauma, acute and stroke. It can also be used to reduce the risk of recoclusion and estrenosis in percutaneous transluminal coronary angioplasty, and thrombosis associated with surgery, isolatemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, antithrombin III, AIII variant 13.C; elastase-resistant; IgG activated neutrophil resistant; anti-thrombin activity; heparin; anti-farcor Xa activity; blood clotting disorder; sepsis; trauma; stroke; thrombin activation.related pathological symptom; restences; thrombosis; acute respiratory distress syndrome; thromboembolism; reocclusion.

The present sequence is from an antithrombin III (ATIII) variant, 13.C derived from human ATII.N135A CDNA insert of the pBluebac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IGG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activationallengery distress syndrome, due to sepsis, trauma, acute respiratory distress syndrome, restenosis, thrombosis, thromboembolism and retenosis in percutaneous transluminal coronary angloplasty, thrombosis associated with surgery, ischeemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; antithrombin III; ATIII variant 7EVEA; elastase-resistant; IgG activated neutrophil resistant; anti-thrombin activity; heparin; anti-factor Xa activity, blood clotting disorder; sepsis; trauma; stroke; thrombin activation-related pathological symptom; restenosis; thrombosis; acute respiratory distress syndrome; thromboembolism; reocclusion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              note= "ATIII.N135A Ala at 387 is substituted by Glu"

"Cloning of the aldehyde reductase gene from a red yeast,
Sporobolomyces salmonicolor, and characterization of the gene and its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
"Hic2, a novel homolog of Hic1 and gammaFBP.";
Submitted (JAN.1999) to the EMBL/GenBank/DDBJ databases.
Submitted (JAN.1999) to the EMBL/GenBank/DDBJ databases.
-- FUNCTION: Transcriptional repressor (By similarity).
-- SUBGNIT: Interacts with CtBP (By similarity).
--- SUBCELLULAR LOCATION: Nuclear (Probable).
--- SIMILARITY: BELONGS TO THE KRUBPPEL FAMILY OF C2H2-TYPE ZINC-FINGER PROTEINS. HIC TRANSCRIPTION FACTORS SUBFAMILY.
--- SIMILARITY: Contains 5 C2H2-type zinc fingers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ALDX SPOSA STANDARD; PRT; 322 AA.

                                                                                                                                 Blockin. Biophy. Acta 1122:57-62(1992).
-!- FUNCTION: Catalyzes the asymmetric reduction of aliphatic and aromatic aldehydes and ketones to an R-enantiomer. Reduces ethyl aromatic aldehydes and ketones to en R-chloro-3-hydroxybutanoate.
-!- CATALYTIC ACTIVITY: An alcohol + NADP(+) = an aldehyde + NADPH.
-!- ENZYME REGULATION: Inhibited by quercetin, dicoumarol and some SH-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE FROM N.A.

                                                                                                                          Name-Short;
IsoId=043593-2; Sequence=VSP 004276;

-i TISSUE SPECIFICITY: Strongest expression of both isoforms is seen in the small intestine, weaker expression in brain and colon, and trace expression is found in liver, pancreas, spleen, thymus, stomach, salivary gland, appendix and trachea. Long isoform is always the most abundant. Long isoform is exclusively expressed at low levels in kidney and testis and short isoform exclusively expressed thigh levels in the skin.

-i- DISEASE: DEFECTS IN HR ARE THE CAUSE OF ALOPECIA UNIVERSALIS (ALUNC); A RARE AUTOSOMAL RECESSIVE FORM OF HAIR LOSS. IT IS CHARACTERIZED BY HAIR FOLLICLES WITHOUT HAIR.

-i- DISEASE: DEFECTS IN HR ARE THE CAUSE OF AUTICHIA WITH PAPULAR LESIONS (APL) (ALSO KNOWN AS CONGENITAL ATRICHIA). THIS AUTOSOMAL RECESSIVE DISEASE: SCHARACTERIZED BY PAPILLARY LESIONS OVER MOST OF THE BODY AND ALMOST COMPLETE ABSENCE OF HAIR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MIM; 209500; -. -1 SUBUNIT: Interacts with NOPP44/46.
-1 SUBCELLUAR LOCATION: NUCLEar, nucleolar.
-1 SIMILARITY: BELONGS TO THE GTP1 / OBG FAMILY. NOG SUBFAMILY.
                                        CATALYTIC ACTIVITY: 5,10-methylenetetrahydrofolate + dUMP = dhydrofolate + dTMP.
Adhydrofolate + dTMP.
PATHWAY: Deoxythonucleotide biosynthesis.
SUBUNIT: Homodimer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 17526, Application US/09252991A

Sequence 17526, Application US/09252991A

Fatent NO 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
ITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGANOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.136

CURRENT FILING DATE: 1999-02-18

PRIOR PILING DATE: 1999-02-18

PRIOR PILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-18

PRIOR FILING DATE: 1998-07-27

                                                                                                                                                                                             AAU15984
                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences (I) is useful as hybridisation probes, polypeptide (II) sequences (I) is useful as hybridisation probes, polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical insorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in the polypeptide and polymucleotide sequences have applications in the polypeptide and polymucleotide sequences have applications in responsible for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers
                                                                                                                                                                                                                                                                                                     The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                  probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human bone marrow expressed probe encoded protein SEQ ID NO: 32837.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow -
